

Topic # 10

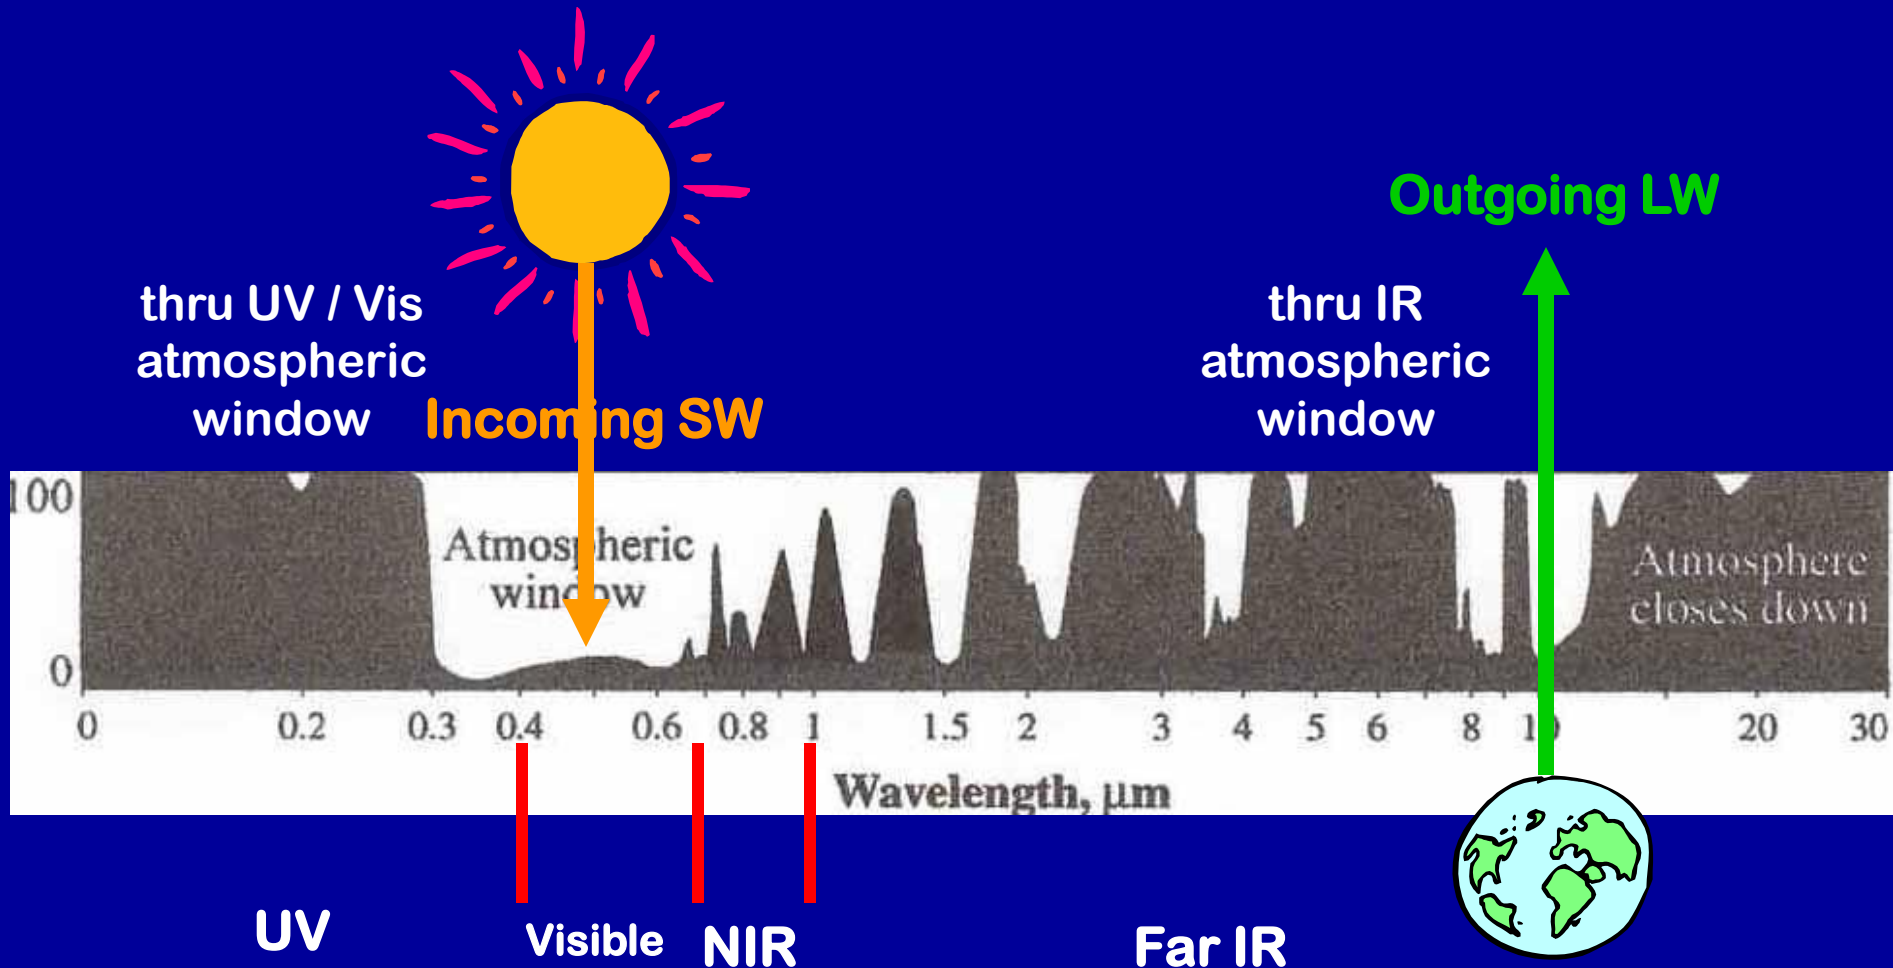

THE EARTH'S GLOBAL ENERGY BALANCE

Part II

$$R_{NET} = \begin{array}{c} \text{SW} \\ \downarrow \end{array} + \begin{array}{c} \text{SW} \\ \vdots \\ \downarrow \end{array} - \begin{array}{c} \text{SW} \\ \nearrow \end{array} - \begin{array}{c} \uparrow \\ \text{LW} \end{array} + \begin{array}{c} \text{LW} \\ \downarrow \end{array} = H + LE + G$$

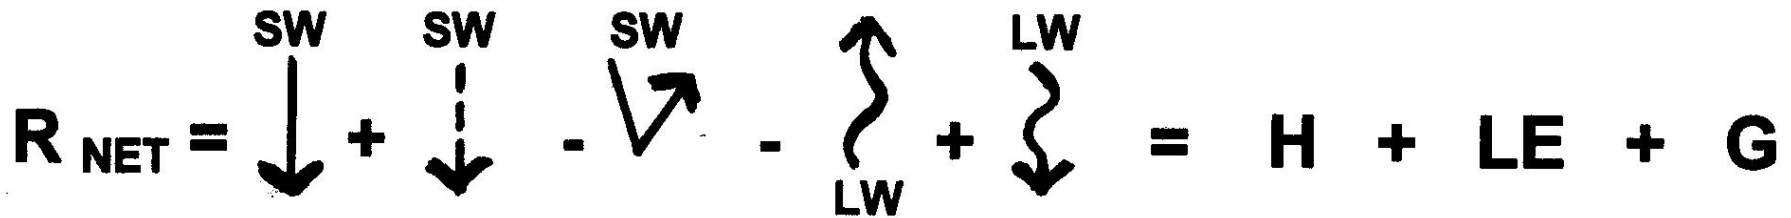

OVERALL
BALANCE:

Incoming = Outgoing

Review

Tuesday's class:

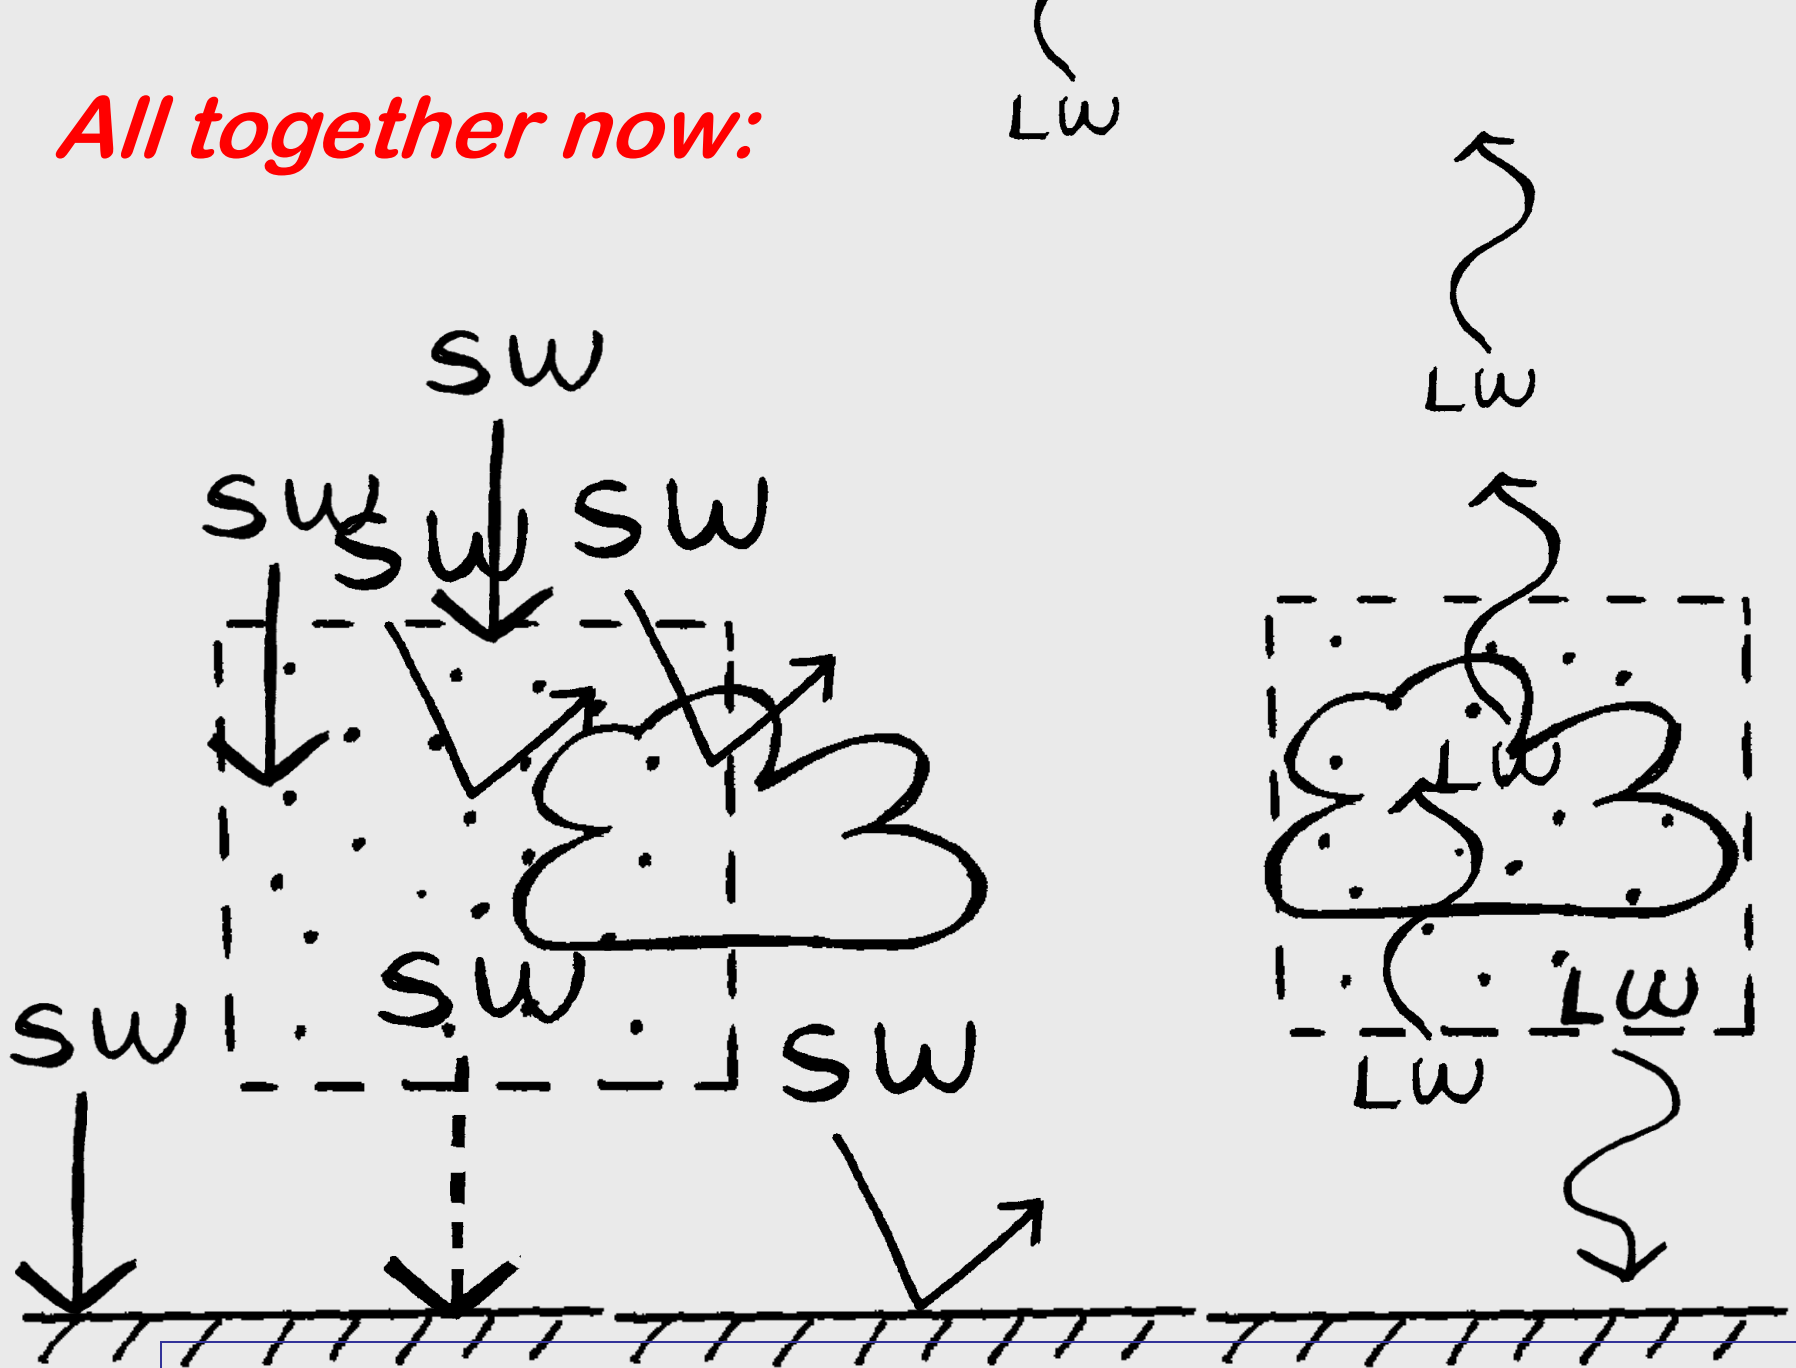

The diagram shows the equation $R_{NET} = \text{SW} \downarrow + \text{SW} \downarrow - \text{SW} \nearrow - \text{LW} \uparrow + \text{LW} \downarrow = H + LE + G$. The terms are represented by arrows: a solid arrow pointing down for SW, a dashed arrow pointing down for SW, a solid arrow pointing up and to the right for SW, a wavy arrow pointing up for LW, and a wavy arrow pointing down for LW. The result is equal to H + LE + G.

$$R_{NET} = \text{SW} \downarrow + \text{SW} \downarrow - \text{SW} \nearrow - \text{LW} \uparrow + \text{LW} \downarrow = H + LE + G$$

R_{NET} : NET RADIATION

$$\text{In} - \text{Out} = R_{NET}$$

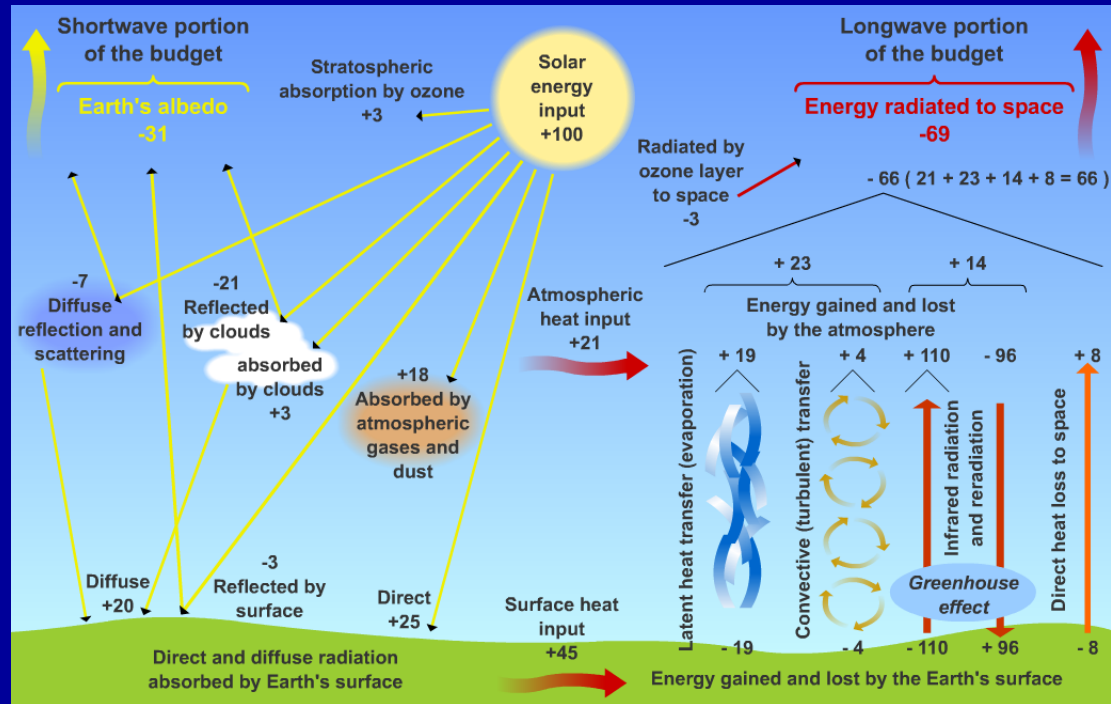

All together now:

Can you sketch all the pathways in yourself? p 130

$$R_{NET} = \text{SW} + \text{SW} - \text{SW} - \text{LW} + \text{LW} = H + LE + G$$

ENCORE:

ENERGY BALANCE ANIMATION:

http://mesoscale.agron.iastate.edu/agron206/animations/10_AtmoEbal.html

Because climate is changing, the “units” in the above animation have changed slightly and differ from some other figures

Earth's new average albedo: $23 + 8 = 31$

$12 + 48 + 9 = 69$

$48 \downarrow - 114 \uparrow + 95 \downarrow = 29 \rightarrow$

$G + H + LE = 0 + 7 + 22 = 29 = R_{net}$

FINAL PART OF TOPIC # 10:

**The RIGHT side of the
ENERGY BALANCE
EQUATION . . .**

Left side of equation

$$R_{NET} = \begin{array}{c} \text{SW} \\ \downarrow \\ \text{+} \\ \text{SW} \\ \downarrow \\ \text{-} \\ \text{SW} \\ \nearrow \\ \text{-} \\ \text{LW} \\ \uparrow \\ \text{+} \\ \text{LW} \\ \downarrow \end{array}$$

$$= H + LE + G$$

Right side of equation

R net = "net" left over energy can be used to **DRIVE WEATHER & CLIMATE** through **HEAT TRANSFER** processes or it can **STORED** by the Earth (in the ground or ocean).

$$R_{NET} = H + LE + G$$

Review of: THERMODYNAMICS & HEAT TRANSFER

Radiation:

Also:

Conduction

Convection

HEAT TRANSFER SUMMARY:

Conduction:

molecule-to-molecule transfer

Most effective in SOLIDS
(earth's surface; soil; the ground)

Convection:

transfer by large-scale movements

Most effective in GASES & LIQUIDS
(atmosphere & oceans)

Radiation:

transfer by **electromagnetic radiation**

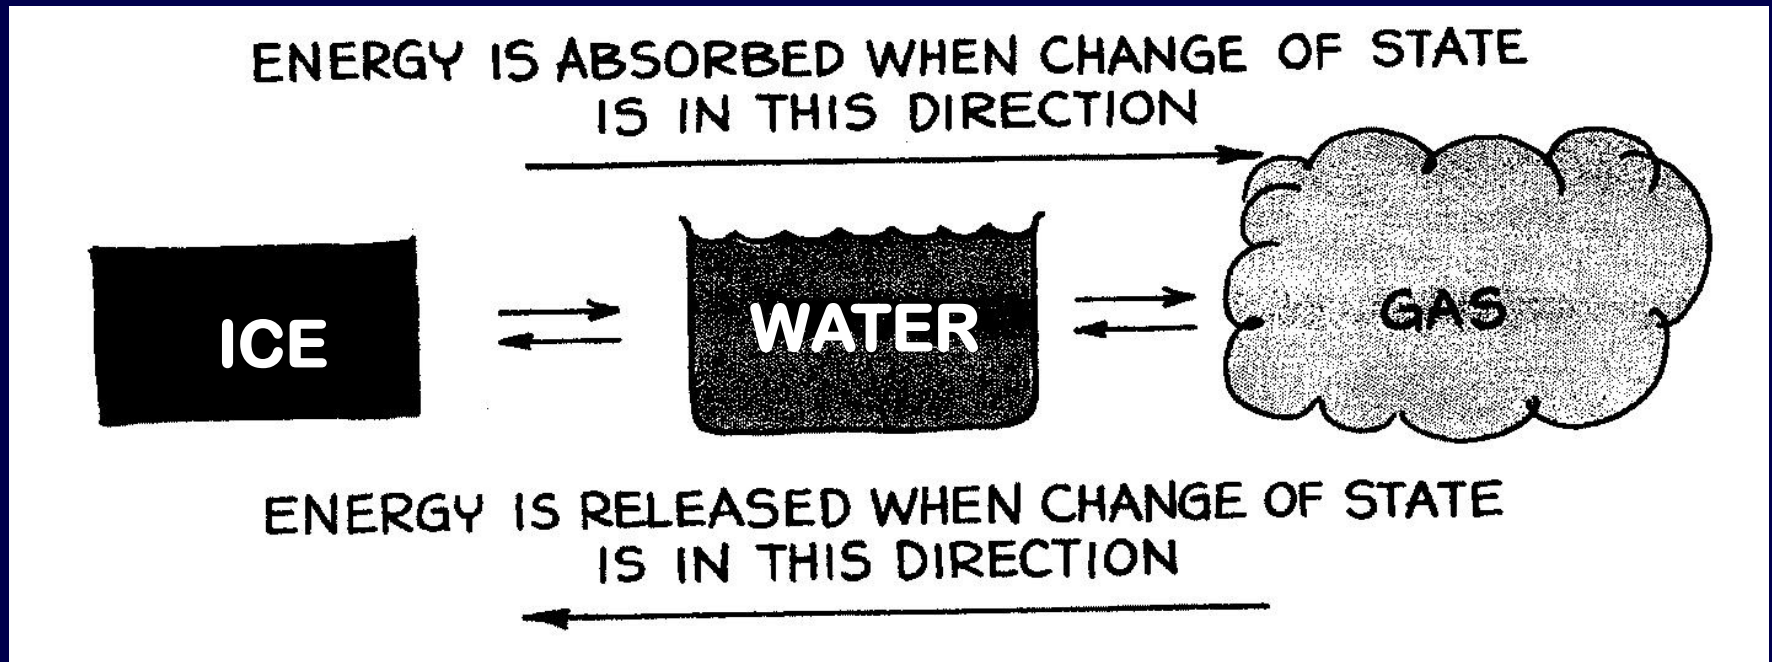

doesn't need MATTER to transfer energy!
(sun → earth, earth → atmosphere,
atmosphere → earth, earth → space)

**PLUS ENERGY TRANSFER DURING PHASE
CHANGES: (topic we skipped earlier!)**

THERMAL ENERGY & PHASE CHANGES IN H₂O

Energy stored as **LATENT ENERGY**
(energy is “hidden” & not sensed)

← Energy released as **SENSIBLE HEAT**
(i.e. the warmth can be “sensed”)

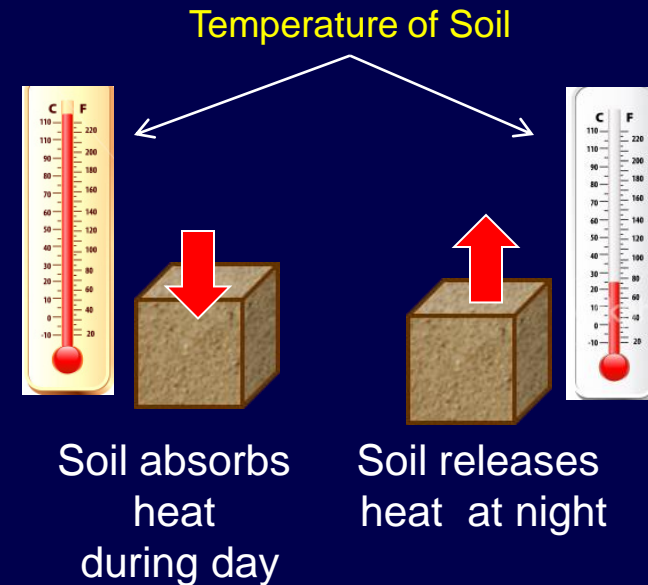

Go back to p 46

DEFINITIONS:

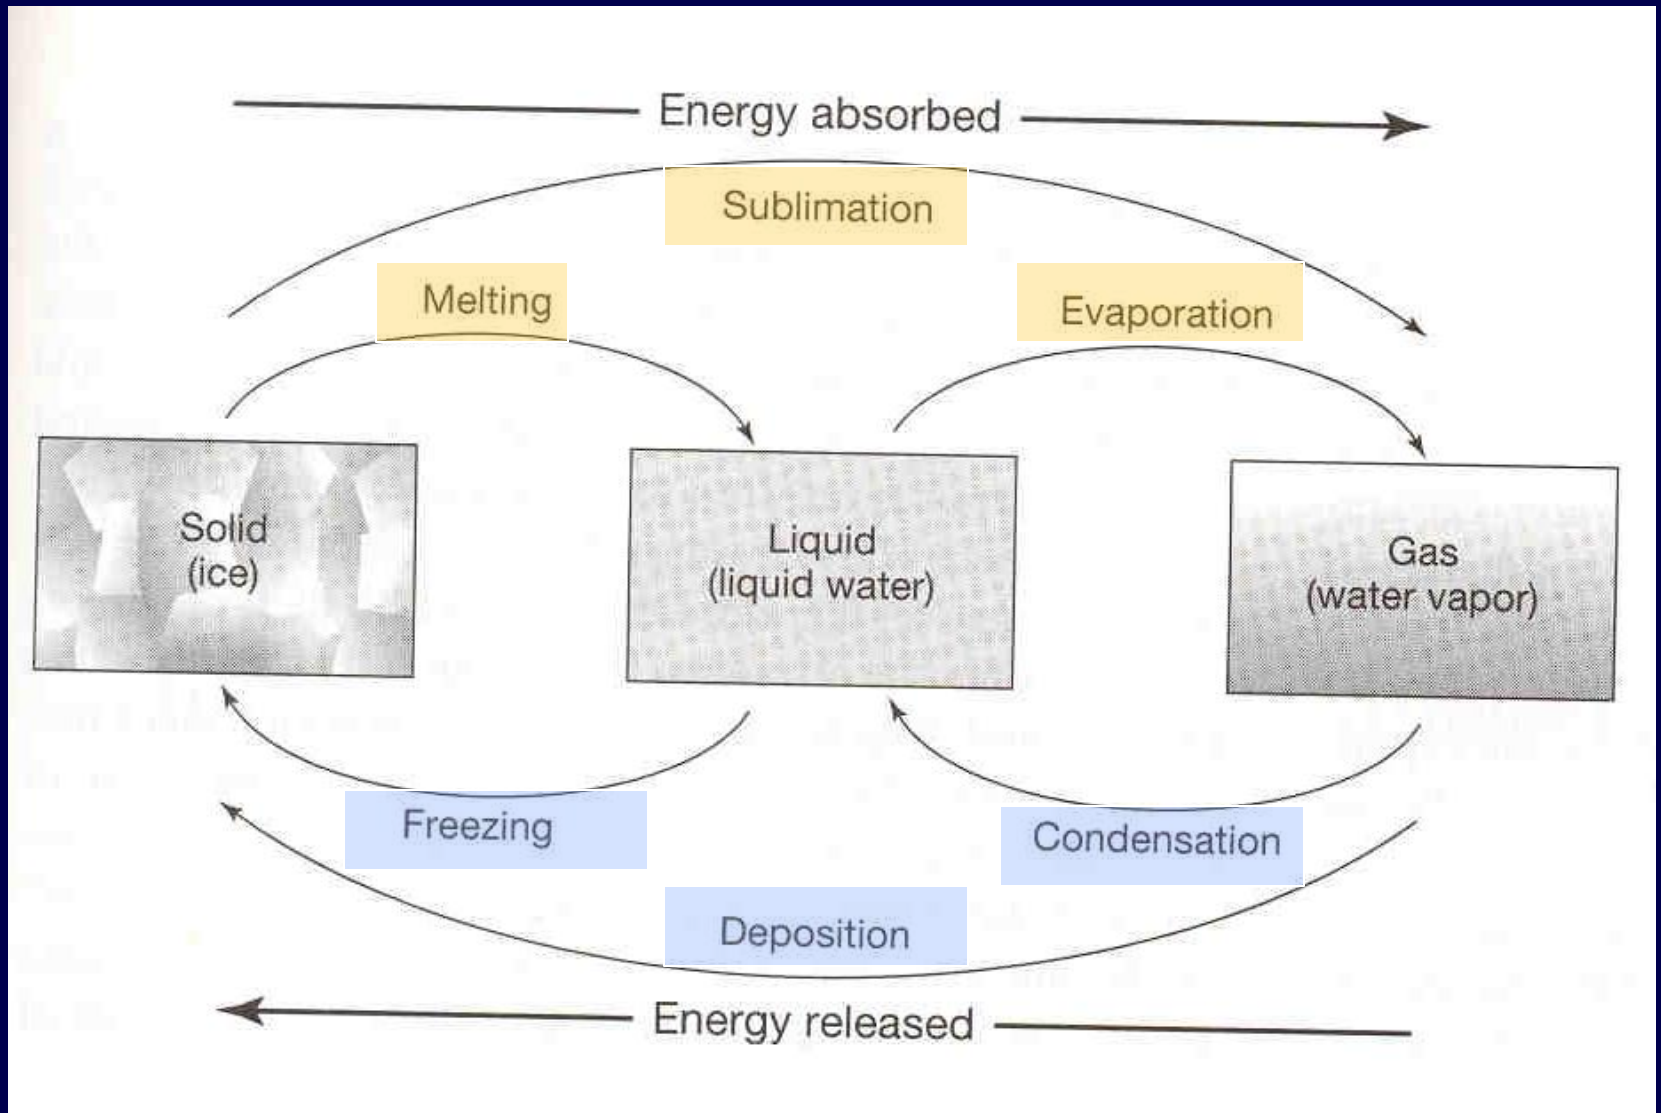

LATENT ENERGY (LE) & SENSIBLE HEAT (H)

LATENT ENERGY (LE) = the amount of energy released or absorbed by a substance during a change of phase, such as when water evaporates.

SENSIBLE HEAT (H) = the amount of energy released or absorbed by a substance during a change of temperature (which is not accompanied by a change of state)

PHASE CHANGES (another view)

This is in your textbook: Fig 4-23 p 77 in SGC E-text

THOUGHT QUESTION:

In this graph, what's happening to the energy in the portions where the graph is horizontal?

HINT: it has to do with

SENSIBLE HEAT (H)

&

LATENT HEAT (LATENT ENERGY) LE

REVIEW / BACKGROUND:

SENSIBLE = the energy can be **SENSED**
(e.g., with a thermometer,
by the environment, etc.)

LATENT (means “HIDDEN”) = the
energy is there, but it is **NOT**
SENSED by the environment,
a thermometer . . . or YOU!

Q1 -- Which segment or segments of the graph represent(s) **SENSIBLE HEAT (H)** ?

1 = X & Z

3 = Y only

2 = X only

4 = Z only

Q1 -- Which segment or segments of the graph represent(s) **SENSIBLE HEAT (H)** ?

1 = X & Z

3 = Y only

2 = X only

4 = Z only

Q2 - In a phase change from ice to water or water to water vapor, WHAT is absorbing the energy?

1 = the surrounding environment

2 = the H₂O molecules

3 = both the environment & the H₂O

Q2 - In a phase change from **ice to water** or **water to water vapor**, **WHAT** is absorbing the energy?

1 = the surrounding environment

2 = the H₂O molecules

3 = both the environment & the H₂O

Q3 - In a phase change from **water vapor to liquid water** or **liquid water to ice**, TO WHERE is the energy being released?

1 = into the surrounding environment

2 = into the H₂O molecules

3 = into both the environment & the H₂O

Q3 - In a phase change from **water vapor to liquid water** or **liquid water to ice**, TO WHERE is the energy being released?

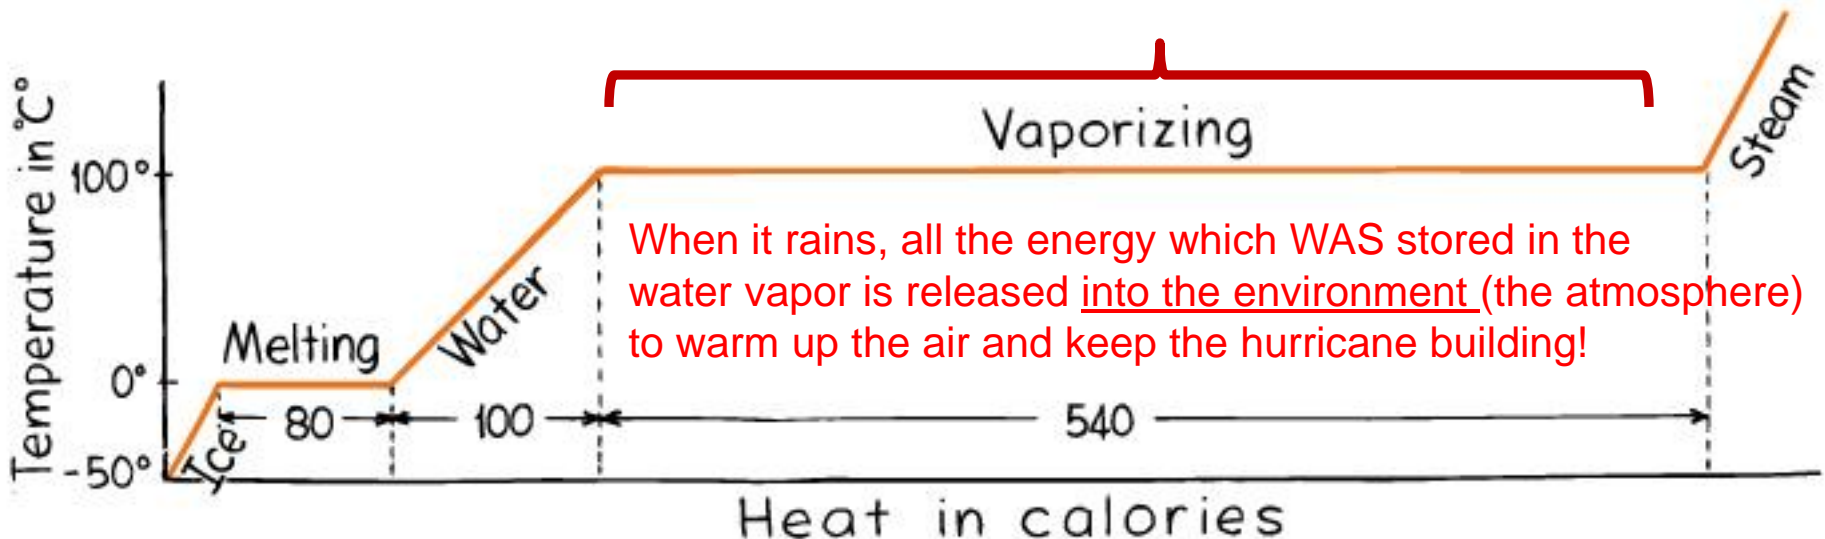

1 = into the surrounding environment

2 = into the H₂O molecules

3 = into both the environment & the H₂O

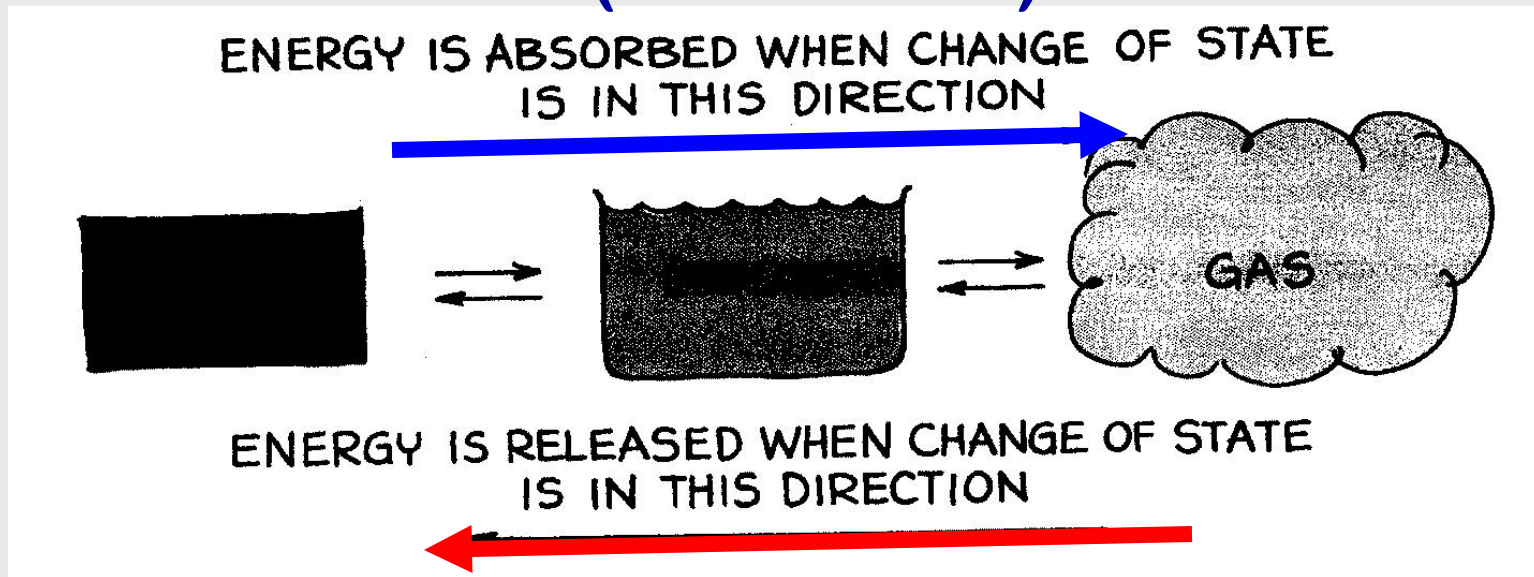

This is what drives tropical storms & HURRICANES!!

HEAT TRANSFER & STORAGE DURING PHASE CHANGES: LE & H

LE = LATENT (hidden) ENERGY
(LE stored)

(LE released, hence it can be sensed as H)

H = SENSED (via thermometer) ENERGY

Link to the Left Side of Equation:

Radiation = the transfer of energy by *electromagnetic radiation*.

It doesn't need MATTER to transfer energy!

(sun → earth, earth → atmosphere, atmosphere → earth, earth → space)

Link to the Right Side of Equation:

$$H + LE + G$$

Conduction & convection
plus energy stored & released
during **phase changes** (latent
energy => sensible heat, etc.)

Link to the Right Side of Equation:

H + LE + G

WHAT IS G???

G = GROUND STORAGE

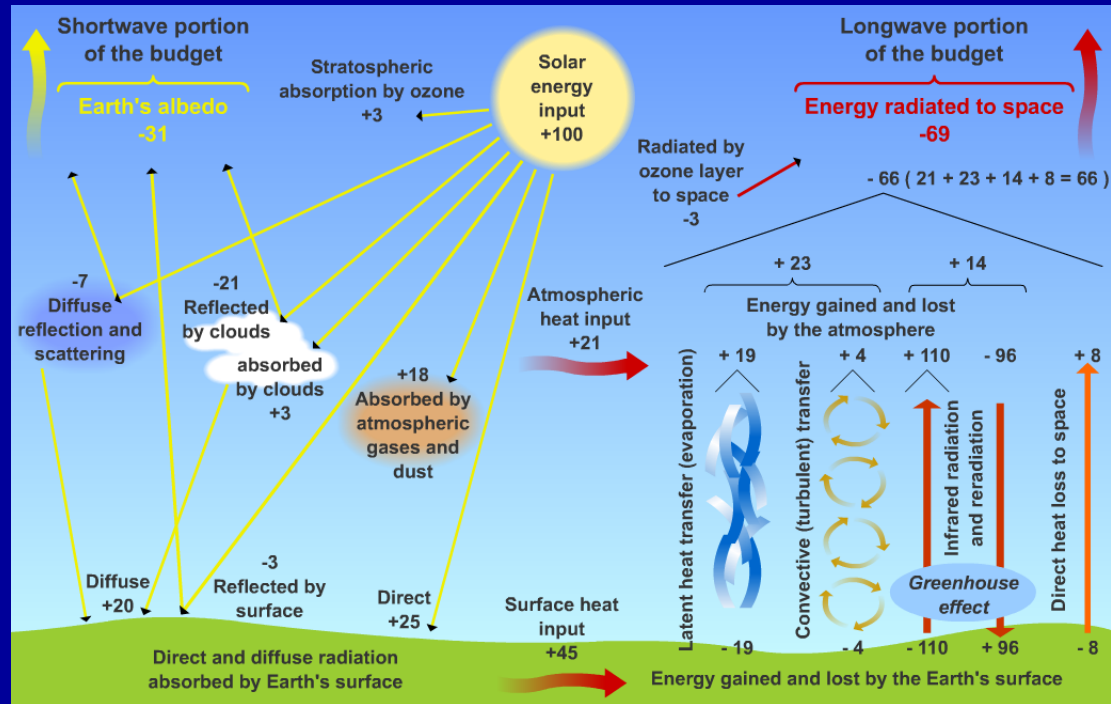

**ENERGY CONDUCTED into soil or
CONVECTED & CONDUCTED into
water (e.g. ocean) and temporarily
STORED THERE**

**Tends to “zero out” over an annual cycle
or several years**

$$R_{NET} = \text{SW} + \text{SW} - \text{SW} - \text{LW} + \text{LW} = H + LE + G$$

ENCORE:

ENERGY BALANCE ANIMATION:

Greenhouse gas emissions from power plants declined from 2011 to 2012, EPA says

By Lenny Bernstein, Published: October 23 [E-mail the writer](#) ↩

Greenhouse gas emissions from power plants and other industrial facilities [declined by 4.5 percent from 2011 to 2012](#) as utilities continued to switch from coal to natural gas to generate electricity and produced slightly less power overall, the Environmental Protection Agency reported Wednesday.

Greenhouse gas emissions from these sources have declined by 10 percent in the two years since the EPA began compiling the data in 2010.

TOPIC # 11

Introduction to Models:

UNDERSTANDING SYSTEMS & FEEDBACKS

Class notes pp 61 - 65

**“When one tugs at a
single thing in nature, one
finds it attached to the
rest of the world.”**

~ John Muir

Dire Predictions

UNDERSTANDING GLOBAL WARMING

The illustrated guide
to the findings
of the IPCC

Intergovernmental Panel
on Climate Change

Michael E. Mann and Lee R. Kump

Our best
projections of what
**the FUTURE
CLIMATE** will be like
are based on **GIANT
COMPUTER
MODELS** – results
are given in the
IPCC Report and
summarized in your
DIRE PREDICTIONS
text.

(More on these
projections later)

Daisyworld:
An Introduction
to Systems

WHAT IS A SYSTEM?

SYSTEM = a set of interacting
components

COMPONENT (*def*) = An individual part
of a system.

A component may be a reservoir of **matter** or **energy**, or some other aspect of the system, a “system attribute” or a subsystem:

e.g. the **atmosphere**, the **energy in the atmosphere** as measured by temperature, or the **amount of CO₂ in the atmosphere**, etc.

SYSTEM MODEL =

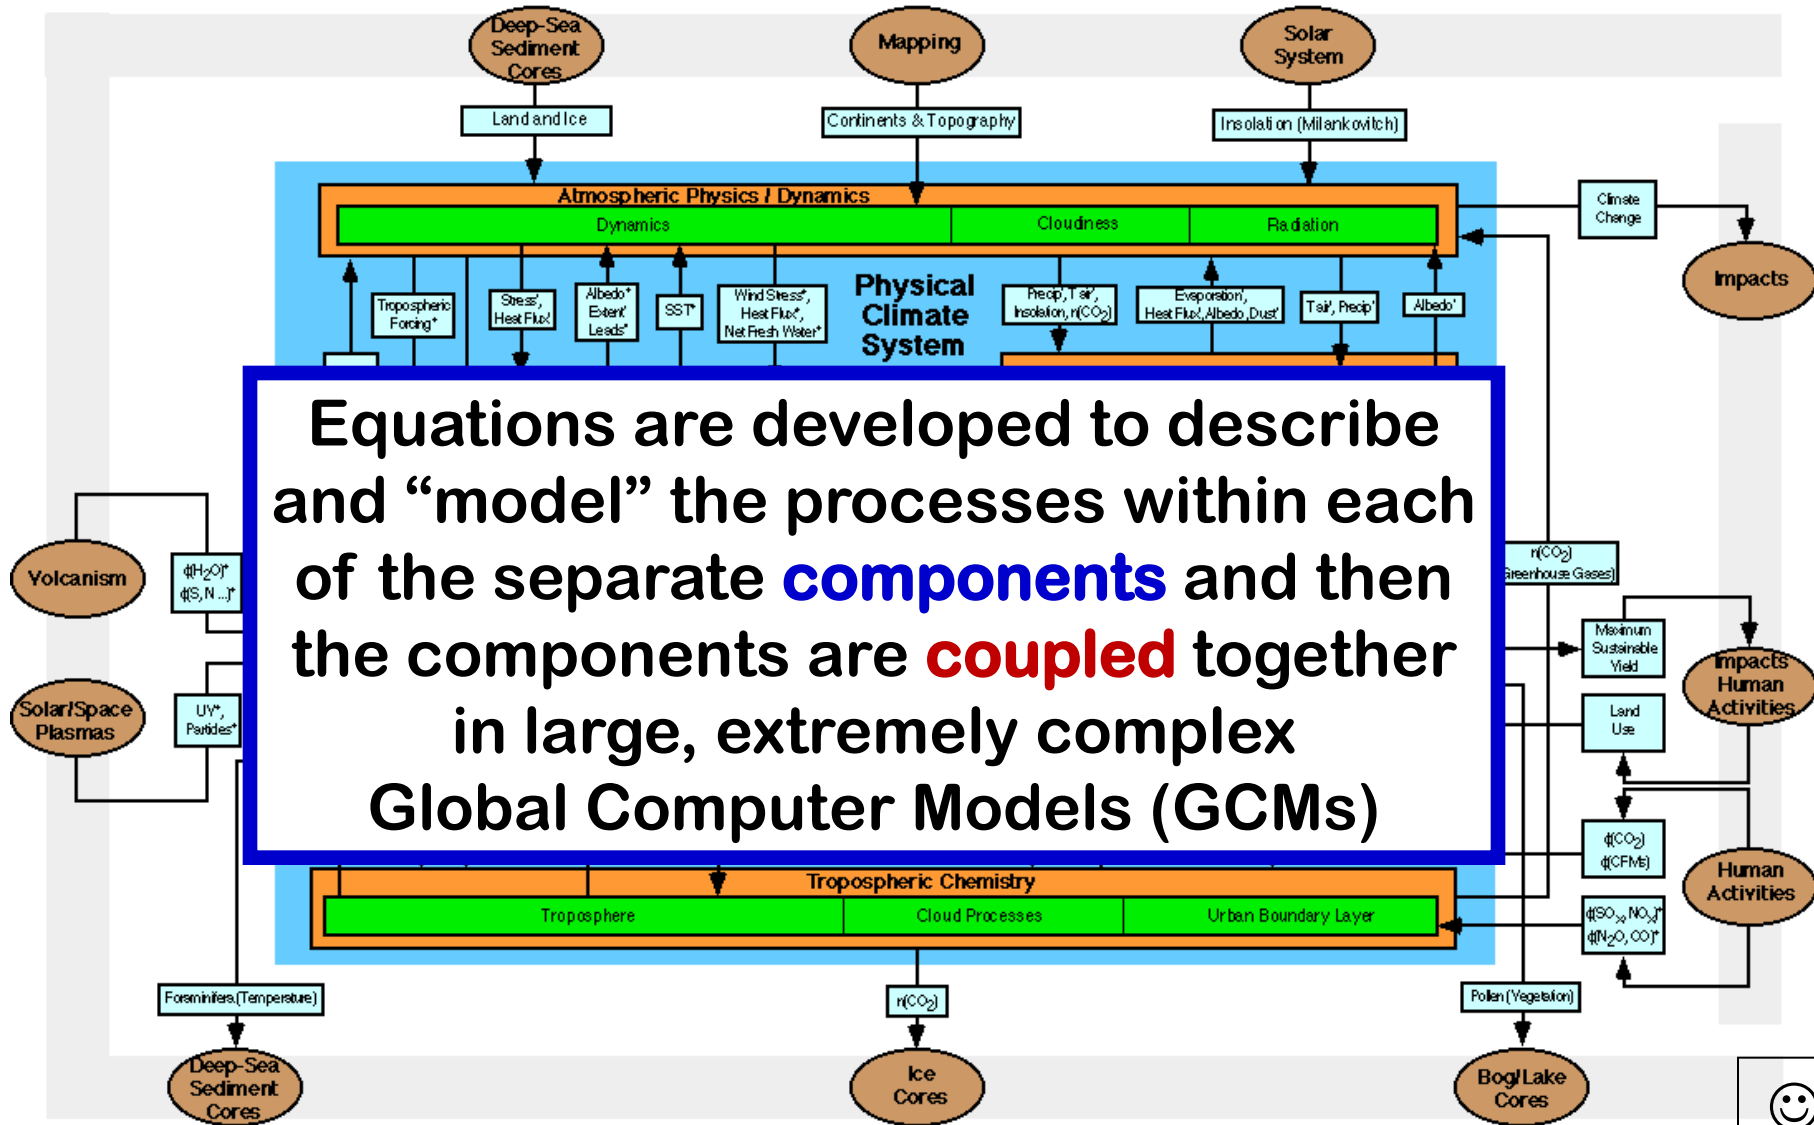

a set of assumptions, rules, data and inferences that **define the interactions AMONG the components of a system** and the significant interactions between the system and the “universe” outside the system

SYSTEM DIAGRAM =

A diagram of a system that uses graphic symbols or icons to represent components in a depiction of how the system works

A complicated “system diagram” of the Earth-Atmosphere System:

CONCEPTUAL MODEL of Earth System process operating on timescales of decades to centuries

Equations are developed to describe and “model” the processes within each of the separate **components** and then the components are **coupled** together in large, extremely complex Global Computer Models (GCMs)

* = on timescale of hours to days * = on timescale of months to seasons ϕ = flux n = concentration

Coupling (def):

The links between any two components of a system.

Couplings can be positive (+) or negative (-)

A coupling between an electric blanket temperature component and a body temperature component:

If the electric blanket's temperature **INCREASES . . .**

The person's body temperature will also **INCREASE**

What type of COUPLING IS THIS?

Positive + OR Negative - ???

A coupling between a person's body temperature and an electric blanket's temperature

If the person's body temperature **INCREASES** and he gets too hot . . .

The electric blanket's temperature control will be turned down and the blanket temperature will **DECREASE**

What type of COUPLING IS THIS?

Positive + OR Negative - ????

THE “RULE” – how to tell if it’s a positive or negative coupling:

Positive couplings have a **solid “arrow”** with a normal arrowhead pointing in the direction of the coupling:

Negative couplings have an **“open circle”** arrowhead pointing in the direction of the coupling:

FEEDBACKS

Feedback mechanism *(def):*

a sequence of interactions in which the final interaction influences the original one.

Feedbacks occur in loops →

Feedback Loop (def) =

A linkage of two or more system components that forms a ROUND-TRIP flow of information.

Feedback loops can be positive (+) or negative (-).

A *positive feedback* is an interaction that **amplifies** the response of the system in which it is incorporated

(**self-enhancing; amplifying**).

A *negative feedback* is an interaction that **reduces** or **dampens** the response of the system in which it is incorporated (**self-regulating**; diminishes the effect of perturbations)

One way to remember the effect that a **NEGATIVE** feedback loop has is to think of the word "negligible"

i.e., a perturbation or disturbance in a system characterized by a **negative feedback loop** will be able to adjust to the perturbation and ultimately the effect on the system will be negligible

FEEDBACK LOOP

What kind of **FEEDBACK LOOP** IS IT?

1) Positive (+)

2) Negative (-) ???

THE “RULE” – how to tell if it’s a positive or negative feedback LOOP:

Count the # of number of **NEGATIVE COUPLINGS**:

If there is an **ODD #** of negative Couplings, the loop is **NEGATIVE**:

If there is an **EVEN #** of negative couplings, the loop is **POSITIVE**

Everyday life example:

Proper alignment of dual control electric blanket:

Improper alignment:

What kind of **FEEDBACK LOOP** IS IT?

1) Positive +

2) Negative -

A **POSITIVE FEEDBACK LOOP**
that amplifies the effect!

QUICK SUMMARY:

- NEGATIVE feedback loops:

- are **resistant to a range** of disturbances (small changes have a “negligible” effect)
- system can **return to it’s beginning state**
- **STABLE** equilibrium state

+ POSITIVE feedback loops:

- **amplify the effects** of disturbances (small changes can “amplify” the response)
- system can become **UNSTABLE** and be taken to a new, amplified state

LINKING TO GLOBAL CHANGE:

In Global Change science we are concerned about **disturbances** that both **humans and natural factors** can produce in the Earth system:

(e.g. increasing carbon dioxide)

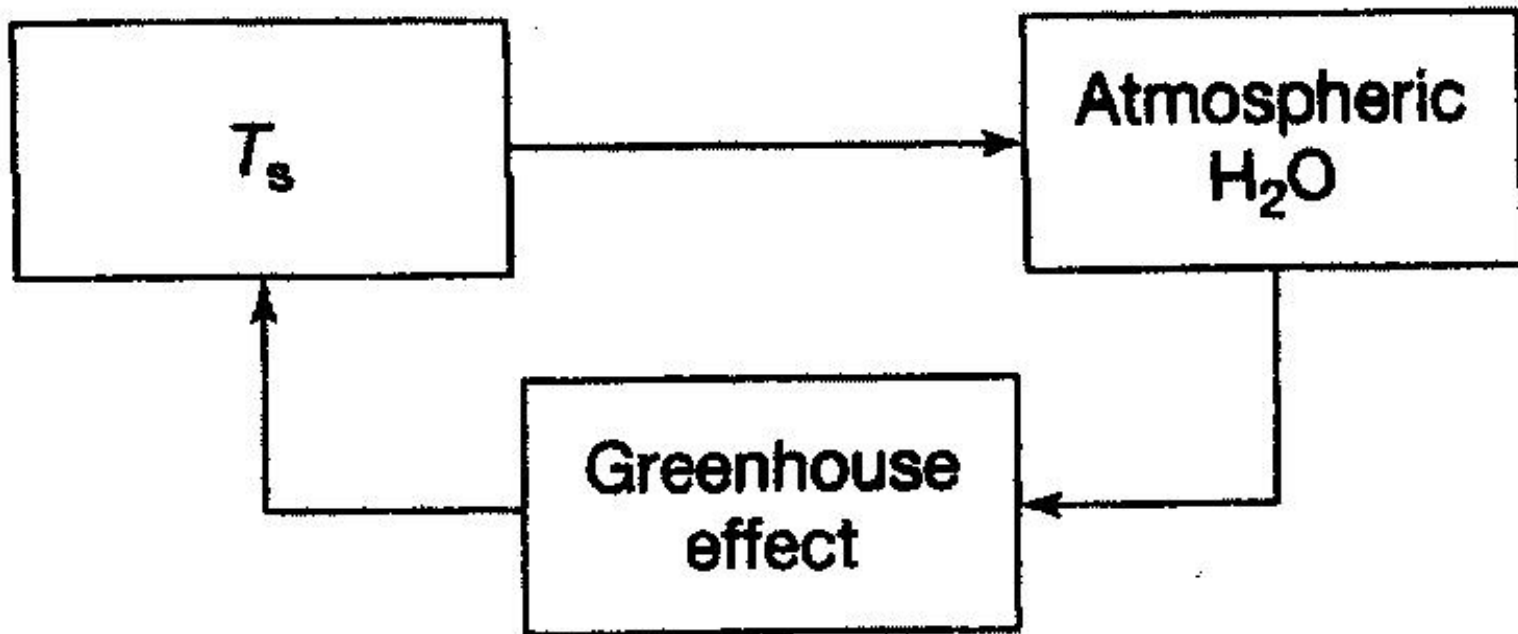

. . . and whether or not the Earth can **adjust** to these and have **a stable equilibrium state**, or be thrown into **an unstable state** due to **positive feedback loops**

WATER VAPOR Feedback in the Earth-Atmosphere

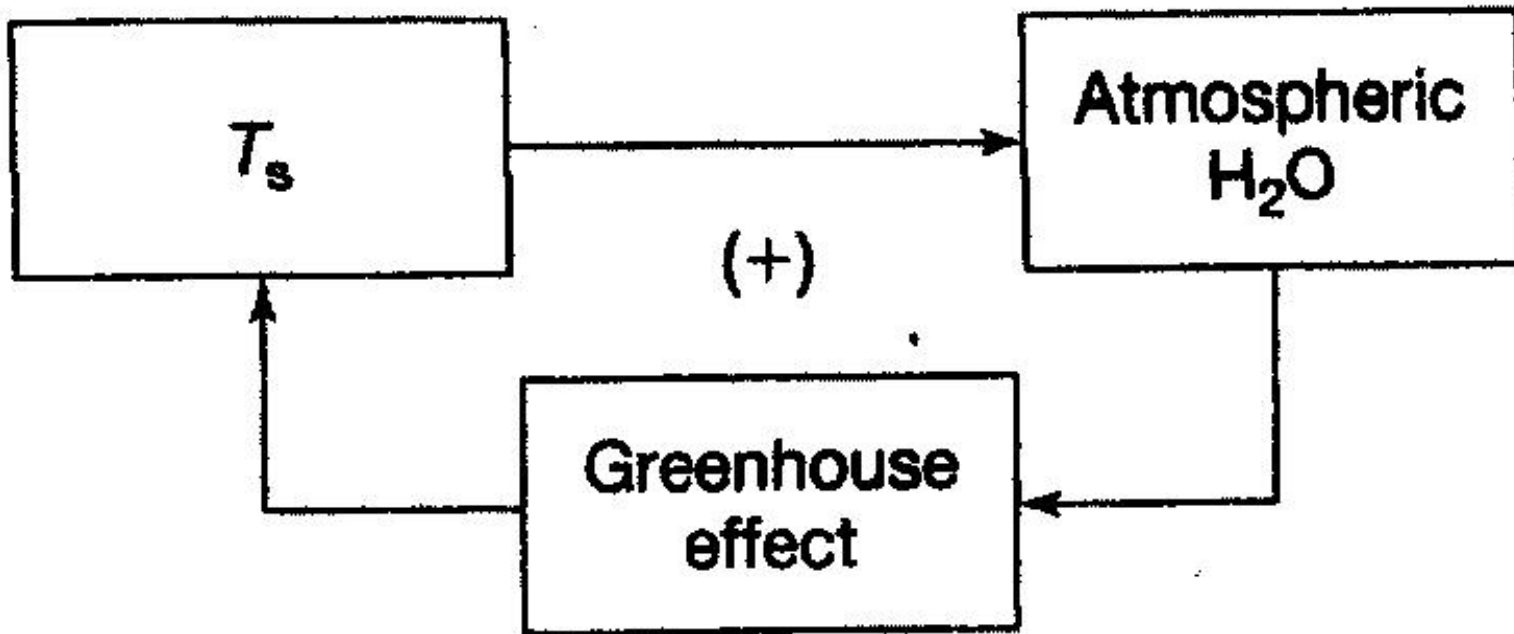

Q4: What kind of FEEDBACK LOOP IS THIS?

1) Positive +

2) Negative -

POSITIVE FEEDBACK LOOP
that **amplifies** the effect!

SNOW AND ICE ALBEDO

Feedback

Q5: What kind of FEEDBACK LOOP IS THIS?

1) Positive +

2) Negative -

ALSO a POSITIVE
FEEDBACK LOOP that
amplifies the effect!
but
HOW DOES IT WORK?

ALBEDO REVIEW →

Fresh Snow & Ice = very high albedo (0.80 - 0.85)

We'll talk about the Daisyworld
Climate System later . . .

TO BE CONTINUED

Have a great weekend!

GO CATS!

GO STUDENTS!
