**Topic #8 The Global Energy Balance
& Answers to G-2 Assignment**

ANNOUNCEMENTS

- **The Midterm Exam is next Thursday, Oct 16th**
- **The Study Guide will be posted by Friday night**
- **STUDY SESSION(s) will be held next week - TBA**

Clicker Q1:

When is the BEST time for a **Midterm Exam Study Session** next week?

- A. Monday 4:00 – 5:30 pm
- B. Tuesday 4:00 – 5:30 pm
- C. Wednesday 4:00 – 6:00 pm
- D. Wednesday 7:00 – 9:00 pm
- E. Wednesday 11 pm – 1 am in D2L chat room
- F. OTHER

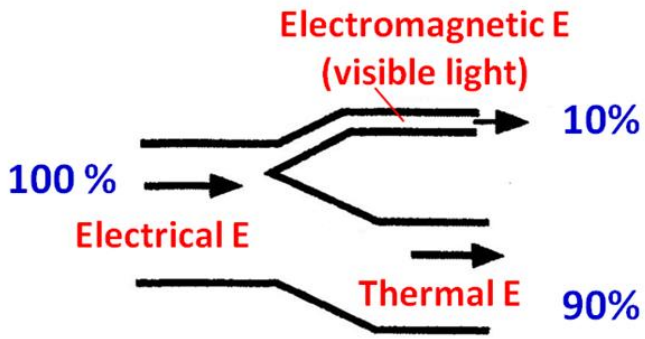

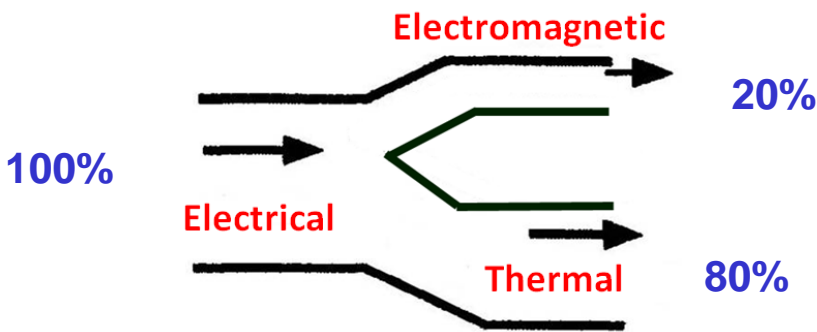

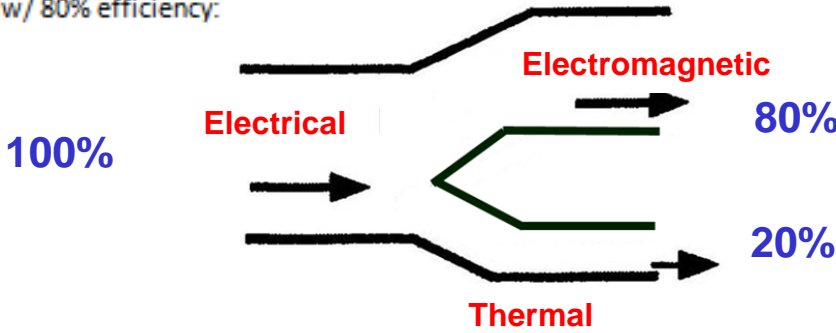

Clicker Q2:

When is the SECOND BEST time for a **Midterm Exam Study Session** next week?

- A. Monday 4:00 – 5:30 pm
- B. Tuesday 4:00 – 5:30 pm
- C. Wednesday 4:00 – 6:00 pm
- D. Wednesday 7:00 – 9:00 pm
- E. Wednesday 11 pm – 1 am in D2L chat room
- F. OTHER

WRAPPING UP TOPIC #7

G-2 ENERGY EFFICIENCY THE ANSWERS

	<p>Diagram for Incandescent bulb</p> 	<p>3</p>
	<p>Diagram for CFL bulb:</p> 	<p>2</p>
	<p>Diagram for LED w/ 80% efficiency:</p> 	<p>1</p>

Common 60W
Incandescent Bulb

uses 60W per bulb
for 800 lumens

1 bulb lasts 1,200 hrs

20 years = 21 bulbs

An **INCANDESCENT BULB** uses heat caused by an electrical current. When electrical current passes through a wire, it causes the wire to heat. The wire, or filament, gets so hot that it glows and gives off **VISIBLE LIGHT**.

In a **CFL**, an electric current is driven through a tube containing argon gas and a small amount of **mercury** vapor. This generates UV radiation that excites a fluorescent coating (called phosphor) on the inside of the tube, which then emits **VISIBLE LIGHT**.

Common 14W
CFL Bulb

uses 14W per bulb
for 800 lumens

1 bulb lasts 10,000 hrs

20 years = 3 CFL bulbs

Source: <http://www.energystar.gov/>

2 Japanese and 1 American Share Nobel in Physics for Work on LED Lights

From left, the researchers Isamu Akasaki, Hiroshi Amano and Shuji Nakamura were awarded the Nobel Prize in Physics for “the invention of efficient blue light-emitting diodes, which has enabled bright and energy-saving white light sources.” Randall Lamb/Agence France-Presse — Getty Images

“They succeeded where everyone else had failed,” the academy said.

Their work has spurred the creation of a whole new industry. The committee that chose the winners said light-emitting diodes, or LEDs, would be the lighting source of the 21st century, just as the incandescent bulb illuminated the 20th.

LED Light Bulbs

uses 12.5W per bulb
for 800 lumens

1 bulb lasts 25,000 hrs

20 years = 1 LED bulb

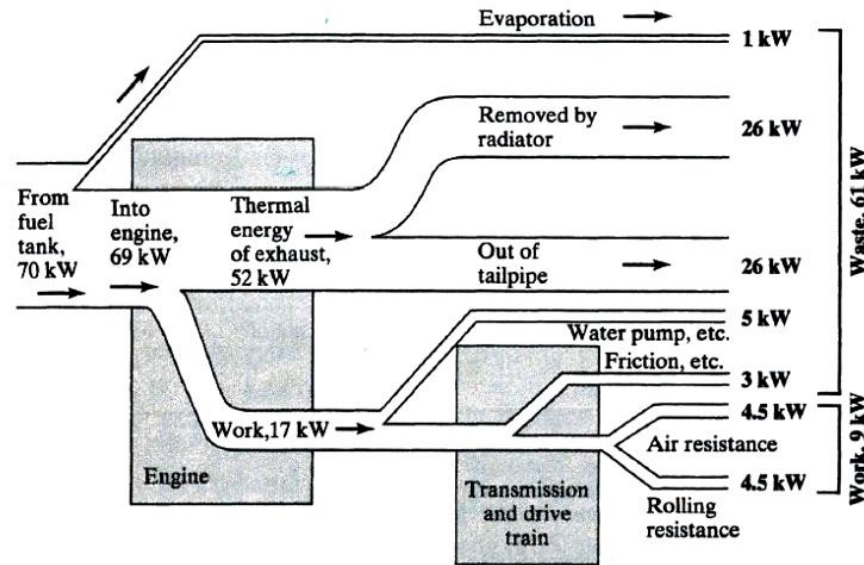

Philips 12.5W AmbientLED Bulb

“LEDs convert electricity directly into photons of light. . .”

ENERGY TRANSFORMATIONS & THE AUTOMOBILE

Energy flow diagram for an unaccelerated gasoline-fueled car at a moderate highway speed

Q1. What % of the energy in the fuel does work running the engine?

Answer = **24%** = Engine's Energy Efficiency

$$(17 \div 70)$$

Q2. What % of the energy in the fuel eventually does "work" that moves the car (by overcoming air resistance and rolling resistance)?

Answer = **13%** = Overall Energy Efficiency of the Automobile

$$(9 \div 70)$$

Q5. Why are FREIGHT TRAINS more efficient?

Q6. Why is AIR FREIGHT the LEAST efficient mode?

Q7. Why is BICYCLING so much more efficient than walking?

Rank the Efficiency of Each Type of Electricity-Producing Power Source:

#1 = Most Efficient

- burning fossil fuel (coal) for electricity

Coal-fired electric power plant

- sunlight to electricity in a solar panel

Photovoltaic (PV) panel

- hydro power turbines

Hydroelectric plant

- wind turbines

Wind farm

ANSWER: Rank the Efficiency of Each Type of Electricity-Producing Power Source:

#1 = Most Efficient

#3 burning fossil fuel (coal) for electricity ~ **33-38%**

Coal-fired electric power plant

#4 sunlight to electricity in a solar panel ~ **15-20%**

Photovoltaic (PV) panel

#1 hydro power ~ **85-90%** turbines

Hydroelectric plant

#2 wind turbines ~ **30-45%**

Wind farm

Estimated U.S. Energy Use in 2009: ~94.6 Quads

Source: LLNL 2010. Data is based on DOE/EIA-0384(2009), August 2010. If this information or a reproduction of it is used, credit must be given to the Lawrence Livermore National Laboratory and the Department of Energy, under whose auspices the work was performed. Distributed electricity represents only retail electricity sales and does not include self-generation. EIA reports flows for non-thermal resources (i.e., hydro, wind and solar) in BTU-equivalent values by assuming a typical fossil fuel plant "heat rate." The efficiency of electricity production is calculated as the total retail electricity delivered divided by the primary energy input into electricity generation. End use efficiency is estimated as 80% for the residential, commercial and industrial sectors, and as 25% for the transportation sector. Totals may not equal sum of components due to independent rounding. LLNL-MI-410527

Topic # 8

THE EARTH'S GLOBAL ENERGY BALANCE

Applying the laws, etc. to understand how processes all work together to create global weather & climate!!

FOR THE ENERGY BALANCE TOPIC

Shortwave SOLAR radiation
(SW) = UV + VIS + Near IR

we'll use SW &
LW abbreviations:

SW = UV + VIS
primarily

+ NIR (Near IR that
“reflects” like VIS)

TERRESTRIAL radiation
(LW) = Far IR

Terrestrial (Earth) radiation
wavelengths:

Far IR, with a maximum at $\sim 10 \mu\text{m}$

LW = all infrared
(Far IR)

Topic # 8

THE EARTH'S GLOBAL ENERGY BALANCE

Applying the laws, etc. to understand how processes all work together to create global weather & climate!!

Go to p 49 &
“bookmark” p 121 in Appendix
in Class Notes
We'll be referring to both sections
in class today

Today's Quote:

A Different Sort of "ENERGY BALANCE":

Look at life as an **energy economy game**. Each day, ask yourself,

Are my energy expenditures (actions, reactions, thoughts, and feelings) productive or nonproductive?

During the course of my day, have I accumulated more stress or more peace?

~ Doc Childre and Howard Martin

Review: Absorption curve for the "Whole Atmosphere"

OVERALL
BALANCE:

$$\text{Incoming} = \text{Outgoing}$$

Typical Energy Balance Diagram

From SGC-E-Text Chapter Fig 3-19

**You've got a similar one
(without labels) on p 49:**

Energy Balance Equation:

$$R_{\text{net}} = (Q + q) - a - Lu + Ld = H + LE + G$$

(one of several ways this equation can be written)

Up till now we've
been emphasizing
Absorption, Emission
& Transmission →

**BUT Electromagnetic
Radiation can also be:**

*Electromagnetic Radiation
can be:*

- **ABSORBED (and EMITTED)**
- **TRANSMITTED**
- **SCATTERED, or**
- **REFLECTED**

Let's see how it all fits together
in the various components of
the **Earth's Energy Balance**

→ We'll use "cartoon symbols" . . .

“CARTOON” SYMBOLS:

To represent
the Earth’s surface:

Note-taking suggested:

on blank page 50

“CARTOON” SYMBOLS:

To represent the atmosphere – composed of both invisible gases, aerosols, dust and other particulate matter:

“CARTOON” SYMBOLS:

To represent CLOUDS

“CARTOON” SYMBOLS:

To represent SOLAR (shortwave) radiation coming in **DIRECTLY**.
(aka **Direct shortwave radiation**)

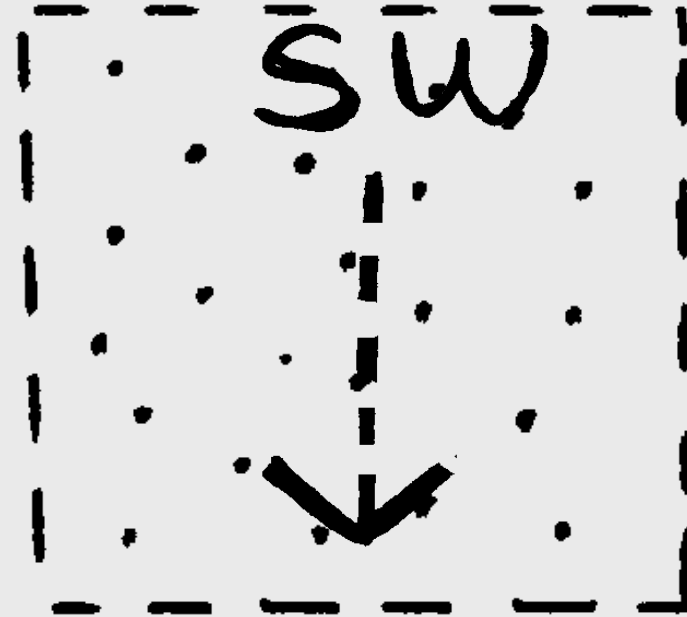

**Direct SW
radiation**
easily casts
well-defined
shadows when
blocked

“CARTOON” SYMBOLS:

To represent SOLAR (shortwave) radiation coming in as **DIFFUSE shortwave radiation**, i.e. scattered by gases, clouds, and particles in the atmosphere.

Scattered,
but still
transmitted!

**Diffuse SW
radiation** is less
likely to cast a
well-defined
shadow!

What does the scattering?

Different sized dust particles, water droplets, aerosols, (even **GAS MOLECULES** themselves!)

- Atom
- DNA molecule
- Amoeba
- Fine dust particle**
- Millimeter
- Centimeter

Typical Object Whose Size Is the Same as This Wavelength:

Scattering of visible light wavelengths

blue wavelengths are scattered easily by gases, water droplets, & fine dust in atmosphere

“Clear” atmosphere composed primarily of fine particles, water droplets, gas molecules

An “aerosol-laden” atmosphere scatters the **LONGER (red) wavelengths** more readily than the shorter blue wavelengths

“Dirty” (aerosol-laden) atmosphere composed of fine particles, gases, & H₂O -- **PLUS larger dust particles, aerosols, pollution, etc.**

ALSO: The **angle** at which direct SW radiation is intercepted by a surface makes a difference!!

Radiation is concentrated over a small area & hence is more intense when it comes in perpendicular to the surface

Radiation is spread out over a larger area & hence is less intense per unit area when it comes in at an angle.

From Figure 3-4 in SGC-E-text, Ch 3

Scenario 1:
NOON at
Point A

Scenario 2: Late
afternoon at
Point A

Q3: which scenario
will deliver **MORE
INTENSE** radiation
to Point A?

1 = Scenario 1

2 = Scenario 2

CLICKER Q!

Scenario 1:
NOON at
Point A

Scenario 2: Late
afternoon at
Point A

Q3: which scenario
will deliver **MORE
INTENSE** radiation
to Point A?

1 = Scenario 1

2 = Scenario 2

Q4- WHY is the intensity of the SW radiation at Point A not as strong in the late afternoon as it is at noon?

CLICKER Q!

1 = because as the Sun goes down close to sunset time, it gives off less radiation

2 = because the SW radiation is coming in at an angle in the late afternoon, and is not directly overhead (perpendicular) like it is at noon.

3 = because the SW radiation is being transmitted through a thicker atmosphere & hence scattered more

4 – BOTH #2 and #3 are applicable!

Q4- WHY is the intensity of the SW radiation at Point A not as strong in the late afternoon as it is at noon?

1 = because as the Sun goes down close to sunset time, it gives off less radiation

2 = because the SW radiation is coming in at an angle in the late afternoon, and is not directly overhead (perpendicular) like it is at noon.

3 = because the SW radiation is being transmitted through a thicker atmosphere & hence scattered more

4 – BOTH #2 and #3 are applicable!

“CARTOON” SYMBOLS:

To represent SOLAR (shortwave) radiation that is **REFLECTED** (or scattered) **BACK TO SPACE** by: atmosphere, clouds, Earth's surface, etc.

Key term:

ALBEDO = reflectivity of a surface
“symbol” = **a**

Represented as:

a decimal from **0 to 1.0** or

% from 0 – 100 % (perfect reflectivity)

Hence, amount **ABSORBED** = $(1 - \text{albedo})$

If a surface's albedo is HIGH, absorption by the surface is LOW
→ **COOLER** surface

If a surface's albedo is LOW absorption by the surface is HIGH =>
HOTTER surface!

Albedos of Some Common Surfaces

<i>Type of Surface</i>		<i>Albedo</i>
Sand		0.20–0.30
Grass		0.20–0.25
Forest	Low albedo	0.05–0.10
Water (overhead Sun)		0.03–0.05
Water (Sun near horizon)		0.50–0.80
Fresh snow		0.80–0.85
Thick cloud	High albedo	0.70–0.80

→ CLOUDS: 0.44 (high, thin clouds) - 0.90 (low, thick clouds)

AVERAGE PLANET EARTH = ~ 0.30

CLICKER Q!

Q5: What will happen to incoming SW over the Amazon Rain Forest if parts of it are deforested?

1 = more SW will be absorbed

2 = less SW will be absorbed

Before

After

Q5: What will happen to incoming SW over the Amazon Rain Forest if parts of it are deforested?

1 = more SW will be absorbed

2 = less SW will be absorbed

SW
↘ ↗

Before

After

“CARTOON” SYMBOLS:

To represent **TERRESTRIAL** (longwave IR) radiation emitted upward by the Earth’s surface or the atmosphere

“CARTOON” SYMBOLS:

To represent TERRESTRIAL
(longwave IR) re-radiation
emitted downward by the
Earth’s ATMOSPHERE

Now flip to p 121 in
Appendix →

PUTTING IT TOGETHER:

Can you place + and - signs where
they ought to go in the equation?

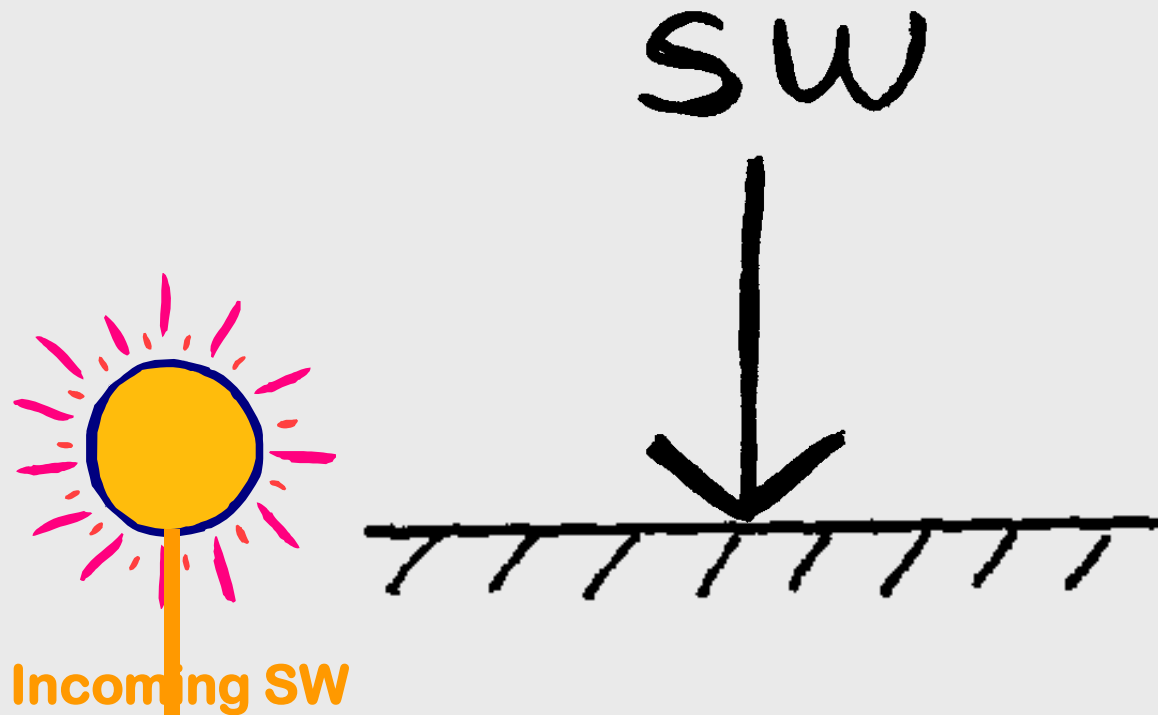

$$R_{NET} = \begin{array}{ccccccc} SW & & SW & & SW & & LW \\ \downarrow & + & \downarrow & - & \swarrow & - & \downarrow \\ R_{NET} = & & & & & & \\ (Q & + & q) & - & a & - & Lu & + & Ld \end{array}$$

$$R_{\text{NET}} = \begin{array}{c} \text{SW} \\ \downarrow \\ \text{+} \end{array} \begin{array}{c} \text{SW} \\ \vdots \\ \downarrow \\ \text{-} \end{array} \begin{array}{c} \text{SW} \\ \searrow \\ \text{-} \end{array} \begin{array}{c} \uparrow \\ \text{LW} \\ \text{-} \end{array} \begin{array}{c} \text{LW} \\ \downarrow \\ \text{+} \end{array} =$$

Now we'll look at the energy pathways in a bit more detail by combining the cartoon symbols in various ways . . .

To describe the real Earth-Atmosphere system, **more detail** is needed in our simple representation
We'll use our symbols to build an **energy balance** “**model**”

SW BEAMED DIRECTLY TO EARTH'S SURFACE WHERE IT IS ABSORBED:

SW REFLECTED BACK TO SPACE:

By
clouds

By
Earth's
surface

This is determined by
the ALBEDO of the
clouds or surface

SW SCATTERED BACK TO SPACE BY ATMOSPHERE:

SW

SW SCATTERED DOWN TO EARTH'S SURFACE where it is absorbed

**SW ABSORBED
IN ATMOSPHERE
BY GASES,
DUST, etc.**
(including Ozone
absorbing shortwave
UV)

SW

SW ABSORBED
In ATMOSPHERE
BY CLOUDS &
H2O vapor:

(NOTE: clouds are made up of tiny droplets of water surrounded by lots of water vapor)

LW (IR) EMITTED
FROM EARTH'S
SURFACE

LW

ESCAPING TO
SPACE THROUGH
THE "OUTGOING IR
ATMOSPHERIC
WINDOW"

Outgoing LW

**IR EMITTED FROM
EARTH'S SURFACE
BUT ABSORBED IN
THE ATMOSPHERE
BY GREENHOUSE
GASES (H₂O, CO₂,
CH₄, ETC.)**

**IR EMITTED
FROM
ATMOSPHERE
ESCAPING TO
SPACE**

IR EMITTED
FROM
ATMOSPHERE
AND RADIATED
BACK TO
SURFACE
WHERE IT IS
ABSORBED

All together now:

Can you sketch all the pathways in yourself? p 122

What if . . .

. . . The Earth didn't have an atmosphere, and therefore didn't have a **greenhouse effect??**

What would the energy pathways in the Earth-Sun system look like?

LW

Which terms are not involved?

No scattering of SW by atmosphere

No downward re-radiation of LW / IR from the atmosphere because there would be **NO GHG's**

$$R_{NET} = \begin{array}{c} \text{SW} \\ \downarrow \\ \text{+} \\ \begin{array}{c} \text{SW} \\ \vdots \\ \downarrow \\ \text{-} \\ \swarrow \\ \text{SW} \end{array} \\ \text{-} \\ \begin{array}{c} \uparrow \\ \text{LW} \end{array} \\ \text{+} \\ \begin{array}{c} \text{LW} \\ \downarrow \end{array} \end{array}$$

R_{NET} : NET RADIATION

In – Out = R_{NET}

$$R_{NET} = \begin{array}{c} \text{SW} \\ \downarrow \\ \text{+} \\ \begin{array}{c} \text{SW} \\ \vdots \\ \downarrow \\ \text{-} \\ \swarrow \\ \text{SW} \end{array} \\ \text{-} \\ \begin{array}{c} \uparrow \\ \text{LW} \end{array} \\ \text{+} \\ \begin{array}{c} \text{LW} \\ \downarrow \end{array} \\ \text{= H + LE + G} \end{array}$$

Place the symbols in the proper places on the diagram (you won't use them all!)

R NET

$$R_{NET} = \downarrow_{SW} + \downarrow_{SW} - \swarrow_{SW} - \uparrow_{LW} + \downarrow_{LW}$$
